

exec

WMPRO, WMMINI FW >= 1.0 WMMEGA FW >= 2.0

Run a script with an optional delay

Description

```
exec ( string $script_name [, int $delay_ms ] )
```

Parameters

script_name: Path and filename of script to execute

delay_ms: Optional delay in milliseconds before script is executed

Return Value

None

Example

```
<?
exec("/scripts/ip.cgi",1000); //run the script in 1 second from now
?>
```

See Also

[function](#) - Define a function

[return](#) - Return program control to the calling module

Additional Information

User defined functions can take many different forms, and it is not necessary to use [exec\(\)](#) to execute a function unless a direct return value is needed.

If used within a function, the [return](#) statement immediately ends execution of the function, and returns its argument as the value of the function call.
