

session_destroy()

This is only applicable for HTTP initiated scripts. An internal `$_SESSION` array is available to all HTTP scripts to allow for persistent variables to be shared between scripts. This array is associated with the script based on a cookie created at login.

`session_destroy()` clears the array. This would clear specific variables like `logged_in`, an integer indicating whether the user is logged in, so a page in WattmonOS (such as the home page) is called after running this function, you would be redirected to the login page once again.
