session_start

WMPRO, WMMINI >= 1.0 WMMEGA FW >= 2.0

Initiate a new session and send the cookie data for it

Description

session_start ( )

This function will start a new session and clear any existing session information. This generates a random session ID and passes it as a cookie back to the browser, so it needs to be called before any other data is sent out. You can then set session variables through the global $_SESSION array.

This is only applicable for HTTP initiated scripts. The $_SESSION array is available to all HTTP scripts to allow for persistent variables to be shared between scripts. This array is associated with the script based on the cookie created.

Parameters

None

Return Values

None

See Also

uPHP Special Variables - Special arrays that are populated automatically (including $_SESSION)

session_destroy() - Clear the current session's data

session_is_new() - Check if a session was just initiated
